Trans. of Akademiya Nauk SSSR. Doklady, 1960, v. 132, no. 2, p. 319-322.

The problem of short-range weather forecasting with the full system of primitive hydrodynamical equations is reduced to the determination of the geopotential (Φ), the horizontal components u and v of the wind, and the equivalent vertical velocity component: $\bar{w} = dp/Pdt$, where p is air pressure, P is the standard sea-level pressure, and t is time.
